

Quickly Generate Large Test Files in Windows

Run the following command:

```
fsutil file createnew <file> <size in bytes>
```

For example, this command will create a 1GB file called 1gb.test on my desktop:

```
fsutil file createnew c:\users\steve\desktop\1gb.test 1073741824
```

The key is to input the size of the file in bytes so here are some common file sizes to save you from math:

1 MB = 1048576 bytes

100 MB = 104857600 bytes

1 GB = 1073741824 bytes

10 GB = 10737418240 bytes

100 GB = 107374182400 bytes

1 TB = 1099511627776 bytes

10 TB = 10995116277760 bytes
