How to Find Computer Locking Active Directory Account

1. Login to the Domain Controller where authentication took place.
2. Open "**Event Viewer**".
3. Expand "**Windows Logs**" then choose "**Security**".
4. Select "**Filter Current Log…**" on the right pane.
5. Replace the field that says "**<All Event IDs>**" with "**4740**", then select "**OK**".

7. Select "**Find**" on the right pane, type the username of the locked account, then select "**OK**".
8. The Event Viewer should now only display events where the user failed to login and locked the account. You can double-click the event to see details, including the "**Caller Computer Name**", which is where the lockout is coming from.

10.
